THE AMMIQUE: ENGINEERED WITH SLEEP IN MIND

Comfort is a key factor to us sleeping well – to offer us the best support, our bed should contour to the natural curves of our moving body, ensuring that we are held constantly and consistently in the perfect sleeping posture.

Research* shows that when choosing a bed we should be looking not only for comfort but also for consistency, hygiene, air flow and adaptability.

The Ammique is the first bed to have been designed to meet all your individual requirements when it comes to sleep. It has been engineered to perform by offering the five benefits of comfort, consistency, air flow, hygiene and adaptability.

For real comfort, the Ammique supports the spine and musco-skeletal structure correctly by following the natural curves of our moving bodies regardless of our weight or shape and because each one of us is being supported independently, there is absolutely no roll together.

The surface of the Ammique sleep system comprises of many thousands of small plastic domed caps. Each cap is fixed onto a plastic rod. The rods are loosely linked together both across and down the bed and all move interdependently. 50% of the rods pass through a plastic support/guide bar and are held within a tension spring allowing upward and downward movement.

By increasing the number of individually moving and supporting components and by allowing the components uninhibited movement (i.e. unrestricted by padding) the surface of the Ammique contours instantaneously to the curves of your moving body.

And there's no need to worry about wear and tear, the Ammique's unique multi- component system has been built to last maintaining the highest level of support for many years to come.

The Ammique has been designed with no padded materials. Instead, three tailored Coversofts, which are removable and washable, are simply fitted over the surface.

For general cleaning, the Ammique side panels can be removed easily allowing access to vacuum the base beneath, where any dust might have accumulated over time.

All the components within the structure of the Ammique are made from either plastic or stainless steel so if really necessary the Ammique can be steamed cleaned.

Within the structure there is a cavity allowing excellent air flow and providing an ideal space for the Ammique to be vented with temperature-controlled air.

The Ammique comes in modules, which are assembled for you by our trained installation team. Because it is delivered in modules, if your bedroom is awkward to reach with restricted access this should not present a problem.

As standard, the Ammique is supplied in ten modules but, if required; extra modules can be added for extra length. Similarly, if space is an issue, a module can be removed to accommodate your needs if appropriate.

The outer frame and the provision of an expansive choice of interchangeable side and foot panels ensure that the Ammique's adaptive design offers easy personalisation.
